

SCIENTIFIC FRAUD: Cooking the Books on Global Warming

*Ordinary people don't understand climate science,
but they do understand cheating.*

The thermometer at an official global warming monitoring site in Marysville, California is situated next to man-made wind breaks and other non-natural elements that create elevated temperature readings.

By John Eidson | FightFiercely.com | February 7, 2015

A three-month investigation by a veteran meteorologist found that surface temperature recordings used to underpin claims of imminently catastrophic global warming totally disregarded official site-location requirements. Throughout the U.S., hundreds of official temperature monitoring stations overseen by the National Oceanic & Atmospheric Administration (NOAA) were placed in locations that created artificially high thermometer readings:

- Adjacent to hot engines of parked vehicles
- On asphalt-covered roofs
- Near hot exhaust vents of air conditioning units
- On heat-retaining airport tarmacs & paved parking lots
- Next to heat-retaining rock formations & brick buildings

Global warming is measured in tenths of a degree, so every artificial upward nudge creates a deceptive picture of actual temperatures. To avoid artificially elevated readings, NOAA's official site-location standards require that thermometers be placed at least 100 feet from any paved or concrete surface, and in a level open area with natural ground cover. Those scientific-based standards have clearly been intentionally subverted, and every voter should demand to know why.
